

Automated Watermaker Tank Selection

Select which freshwater tank is filled by your watermaker without operating hidden manual valves.

THE SOLUTION

Smart control of water distribution across multiple onboard tanks.

On many yachts, watermakers feed multiple freshwater tanks. Selecting which tank to fill typically requires manual switching of a 3-way valve - often located deep in the bilge or other hard-to-access areas. This manual process is inconvenient and prone to errors, especially during frequent tank switching or when monitoring tank levels over longer periods.

Key benefits

- Automatic selection of target water tank
- No manual valve switching in the bilge
- Seamless integration with watermaker operation
- Remote control from anywhere onboard

KEY POINT 1

Automatic selection of target water tank

KEY POINT 2

No manual valve switching in the bilge

KEY POINT 3

Seamless integration with watermaker operation

YOUR YACHT. YOUR CONFIGURATION.
